

Sht 1

How to make a Dalek.

Paste or glue the parts down on a thin card or thick paper – thick brown paper will do. Note that the three parts making the antennae rods are not so backed, but used as they are – paper rolled up. Note also that disc 'F' should be glued to a piece of thick card.

Cut each piece out to black edges; all dotted lines should be lightly scored with a sharp knife so that tabs, etc., will bend easily.

Follow the directions printed near each part and make the model in this order; part 'A' (base), part 'B' (body), part 'C' (cone), parts 'D' & 'E' (head).

Small drawings. Figures 1-4, show the appearance as you go along.

After making and putting together parts 'A', 'B' and 'C' (see fig.3) make the pivot which allows the head to be revolved. Study carefully the notes on disc marked 'Top of part C' discs 'F', 'G' & 'H' before proceeding with the head.

Fig. 4 shows completed model with antennae in position; the antennae are loosely fitted inside brackets and can be moved about.
